Understanding the RMF Process for DOD Information Technology

Damon Lam
SPAWAR

Hank Osborne
SPAWAR
What is Risk Management Framework (RMF)

▼ What is RMF?
   ▪ New authorization process that requires DoD Information Systems (IS) and Platform Information Technology (PIT) systems to assess their Cybersecurity risks
     – Replaces DIACAP
     – Emphasizes Continuous Monitoring in lieu of compliance checks

▼ Goals of RMF
   ▪ Base authorization decisions on the acceptance of risk and not the management of vulnerabilities
   ▪ Perform risk assessment throughout SDLC
   ▪ Improve understanding of risks to systems and missions

▼ Allows systems to potentially inherit security control implementation

▼ Security control selection and implementation occurs as part of the SDLC

▼ Uses continuous monitoring to support risk management decisions and maintain organizational risk tolerance at acceptable levels

DoD RMF Steps

Step 1: CATEGORIZE System
- Categorize the system in accordance with the CNSSI 1253
- Initiate the Security Plan
- Register system with DoD Component Cybersecurity Program
- Assign qualified personnel to RMF roles

Step 2: SELECT Security Controls
- Common Control Identification
- Select security controls
- Develop system-level continuous monitoring strategy
- Review and approve Security Plan and continuous monitoring strategy
- Apply overlays and tailor

Step 3: AUTHORIZE System
- Prepare the POA&M
- Submit Security Authorization Package (Security Plan, SAR, and POA&M) to AO
- AO conducts final risk determination
- AO makes authorization decisions

Step 4: ASSESS Security Controls
- Develop and approve Security Assessment Plan
- Assess security controls
- SCA prepares Security Assessment Report (SAR)
- Conduct initial remediation actions

Step 5: IMPLEMENT Security Controls
- Implement control solutions consistent with DoD Component Cybersecurity architectures
- Document security control implementation in Security Plan

Step 6: MONITOR Security Controls
- Determine impact of changes to the system and environment
- Assess selected controls annually
- Conduct needed remediation
- Update Security Plan, SAR, and POA&M
- Report security status to AO
- AO reviews reported status
- Implement system decommissioning strategy

Control Example

Control Example

Control: The information system generates audit records containing information that establishes what type of event occurred, when the event occurred, where the event occurred, the source of the event, the outcome of the event, and the identity of any individuals or subjects associated with the event.

Supplemental Guidance: Audit record content that may be necessary to satisfy the requirement of this control includes, for example, time stamps, source and destination addresses, user/process identifiers, event descriptions, success/fail indications, filenames involved, and access control or flow control rules invoked. Event outcomes can include indicators of event success or failure and event-specific results (e.g., the security state of the information system after the event occurred).

Related controls: AU-2, AU-8, AU-12, SI-11.

Control Enhancements:

(1) CONTENT OF AUDIT RECORDS | ADDITIONAL AUDIT INFORMATION
The information system generates audit records containing the following additional information:
[Assignment: organization-defined additional, more detailed information].

Supplemental Guidance: Detailed information that organizations may consider in audit records includes, for example, full-text recording of privileged commands or the individual identities of group account users. Organizations consider limiting the additional audit information to only that information explicitly needed for specific audit requirements. This facilitates the use of audit trails and audit logs by not including information that could potentially be misleading or could make it more difficult to locate information of interest.

(2) CONTENT OF AUDIT RECORDS | CENTRALIZED MANAGEMENT OF PLANNED AUDIT RECORD CONTENT
The information system provides centralized management and configuration of the content to be captured in audit records generated by [Assignment: organization-defined information system components].

Supplemental Guidance: This control enhancement requires that the content to be captured in audit records be configured from a central location (necessitating automation). Organizations coordinate the selection of required audit content to support the centralized management and configuration capability provided by the information system. Related controls: AU-6, AU-7.
